ON THE NYMEX MARKET

September NatGas futures ended the week \$.14 cents higher this week. NatGas declined as some weather forecasts were adjusted for cooler temperatures next week, while the market see the recent tropical activity isn't expected to pose a major threat to production. Extend hot weather is not likely as we a near the end of the summer so hurricanes are the driver. The 2013 hurricane season is still expected to average more active than the long-term normal. While only 5 named storms have been seen to date, the 5 year average to this point is just 4.8 named storms. On average, the last five years, as well as the entire 1995-2012 period, has seen about 11 named storms and 7 hurricanes between now and the end of the season. So, if activity during the remainder of the season is just in-line with recent history we should end up with something close to 16 named storms and 7 hurricanes. This should be an interesting week, think about if fixing your NatGas prices is right for you.
